

Project #1

Command Line Task Manager

Implement a c# program which is a task manager enabling the user to handle processes over command line. It must achieve the following:

- 1) The user can list processes. Each process should be displayed with the process id (pid) and CPU usage within this process.
- 2) The program should enable the user to kill a specific process. The user can input the pid, hence the process with the entered pid should be killed.
- 3) The program should give the user the ability to change the priority of a specific process. The user enters the process id and desired priority to the program, then the process priority changes accordingly.

- The deadline of the project is March 31, 2020.
